

One Day Paper:

Choice 1: We are on the verge of an Artificial Intelligence boom within the next 8-10 years. With that comes a lot of ethical issues and debates. If an AI passes the Turing Test, do we have the right to turn off the machine, or would that be murder? What are the ethical rights given to an AI that doesn't know it's not real? Should they be treated like any other living creature on Earth?

Choice 2: We are at a time when the idea of "Organs to Order" is not far in the distance. Let's say you need a new kidney and the donor list is too long for the time you have left... but there's another option. A copy of you of born and raised in a lab with the intention of harvesting it's organs when you a new heart or some other part. Is this okay? Having a living person used solely for your own benefit?
